

# Systematic Identification of High Crash Locations

Iowa Traffic Safety Forum  
September 6, 2001

# Project Team

- **Steering Committee:**
  - Tom Welch (IaDOT, Highway Safety)
  - Mark Perington (Snyder & Assoc. – cities)
  - Bob Sperry (Webster County)
  - Bill Schuman (IaDOT GIS Coordinator)
- **CTRE Staff:** Reg Souleyrette, Ali Kamyab, Keith Knapp, Zach Hans, Aemal Khattak, Raj Basavaraju

# Problem Statement

- “reactive” engineering consumes resources
- Iowa has a method - limited
- opportunity: GIS to combine/mine databases and new statistical methods
- need a statewide, systematic method to correct poor function PRIOR to loss
- make use of analysis and experts

**Proposed method, looking for locations  
where we can make a difference!**

# Methodology

- Identify Candidate Problem Types
- Select Problem Types
- Collect Existing Data
- Create New Data (e.g. Curves, Corridors)
- Rank Locations (Frequency, Severity, Rate)
- Perform Statistical Analysis
  - Descriptive, Regression
- Share Results with Field Experts – Iterative process, involving
  - Validation, Education, Adjustment
- Application

# Potential Study Topics

## Safety impact of...

- Elderly drivers
- Horizontal curve characteristics (e.g., degree, radius)
- Speed limits of 50 mph or more on expressways
- Traffic volume and traffic mixture
- Speed limit
- Shoulder surface (e.g. paved, unpaved)
- Number of accesses per mile
- Pavement markings
- Signalized turning bays
- Turn lanes in creating traffic turbulence and weaving

## High crash locations...

- During Wet weather conditions
- For Run-off-the-road crashes
- For Fixed-object crashes
- At Urban 4-lane undivided roadways
- At Signalized intersections
- At Stop-signed intersections

# Study Topics

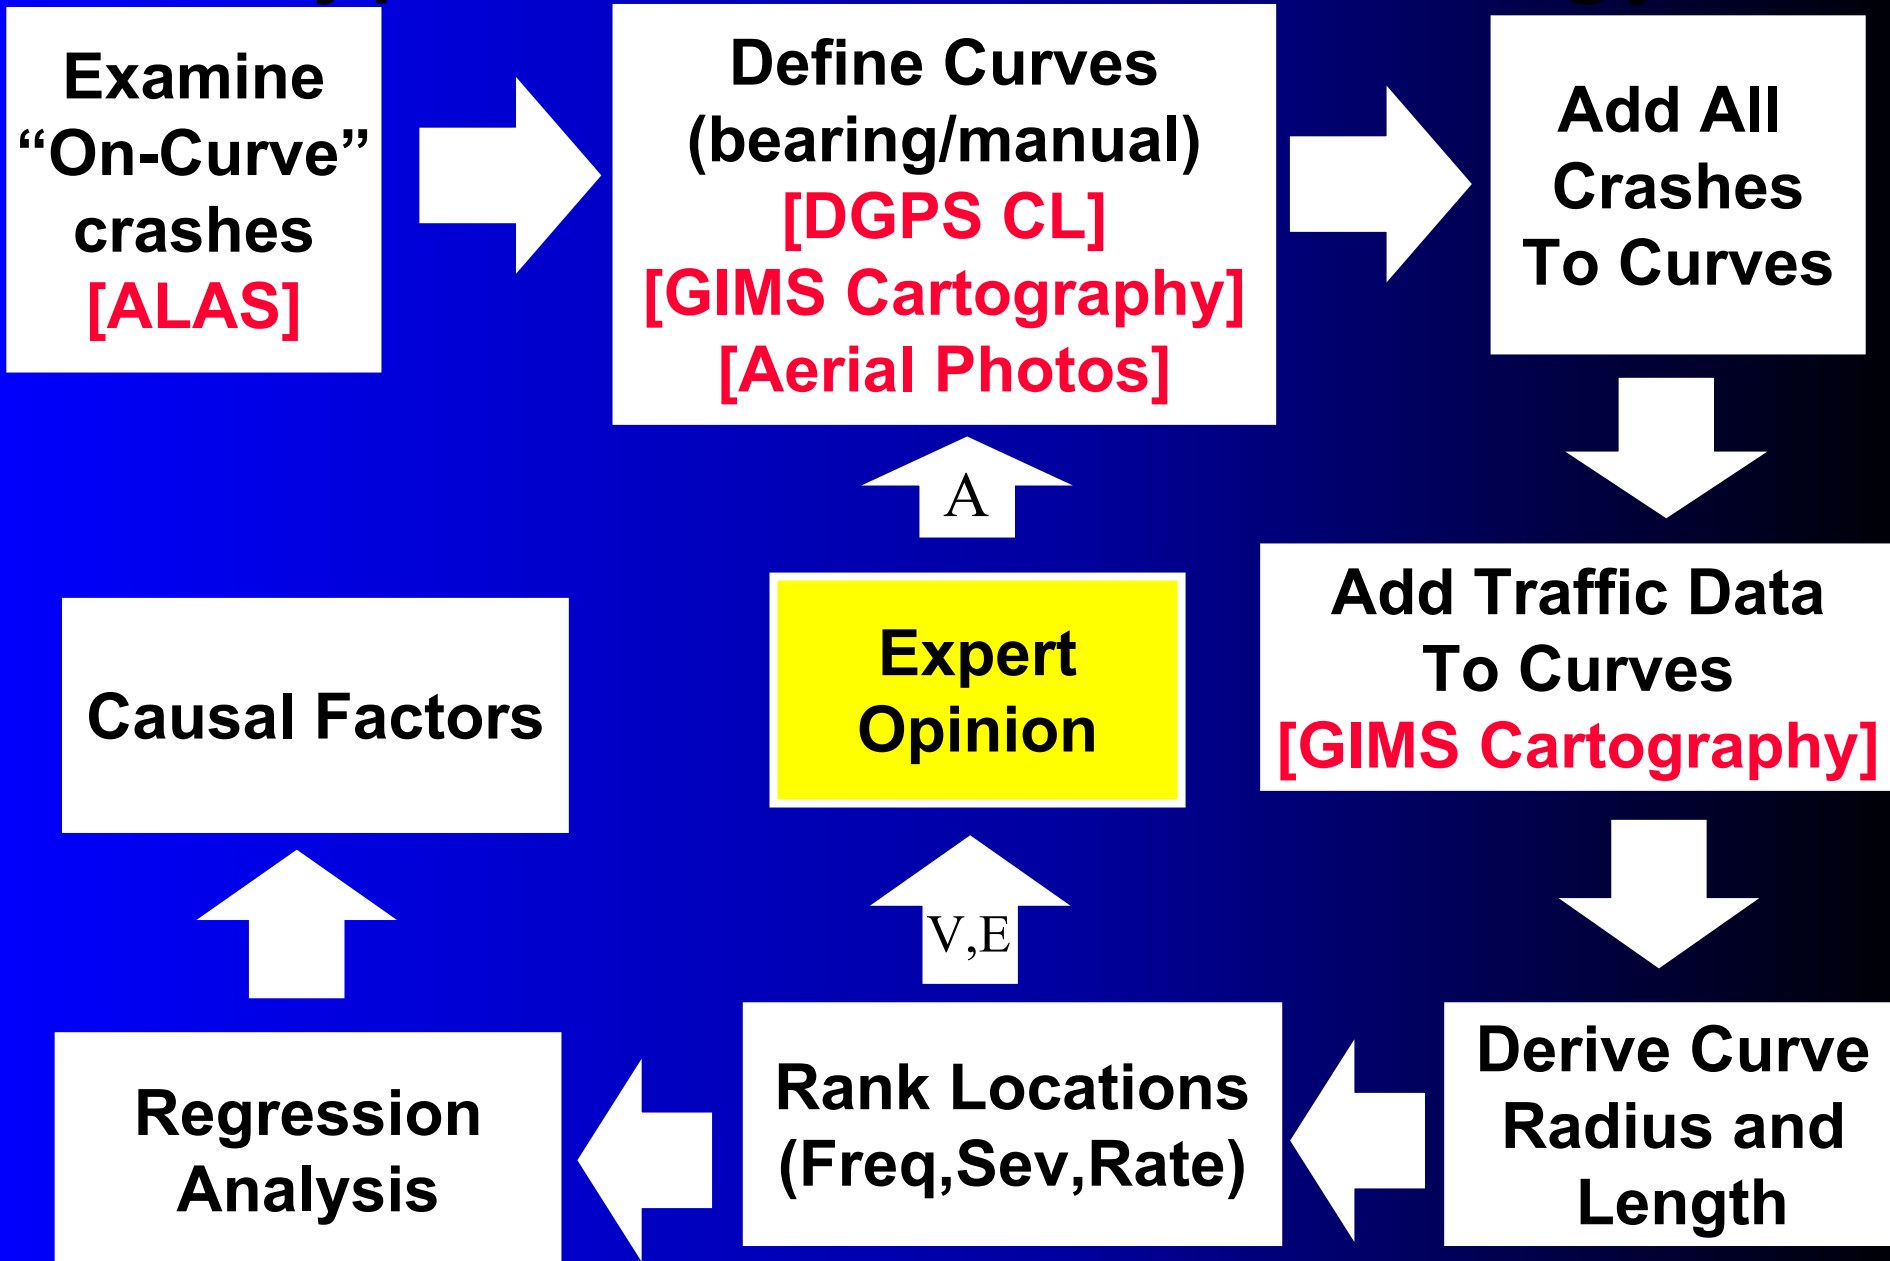

# Available Databases

- Roadway centerline graphics and attributes (Geographic Info & Management System, GIMS)
  - Office of Transportation Data
- Crash data (ALAS) - spatial and attribute data
  - GIS-ALAS & Access-ALAS
- Roadware DGPS - driving lane
  - Primary, FAE Secondary & Municipal, Paved?
- Aerial images

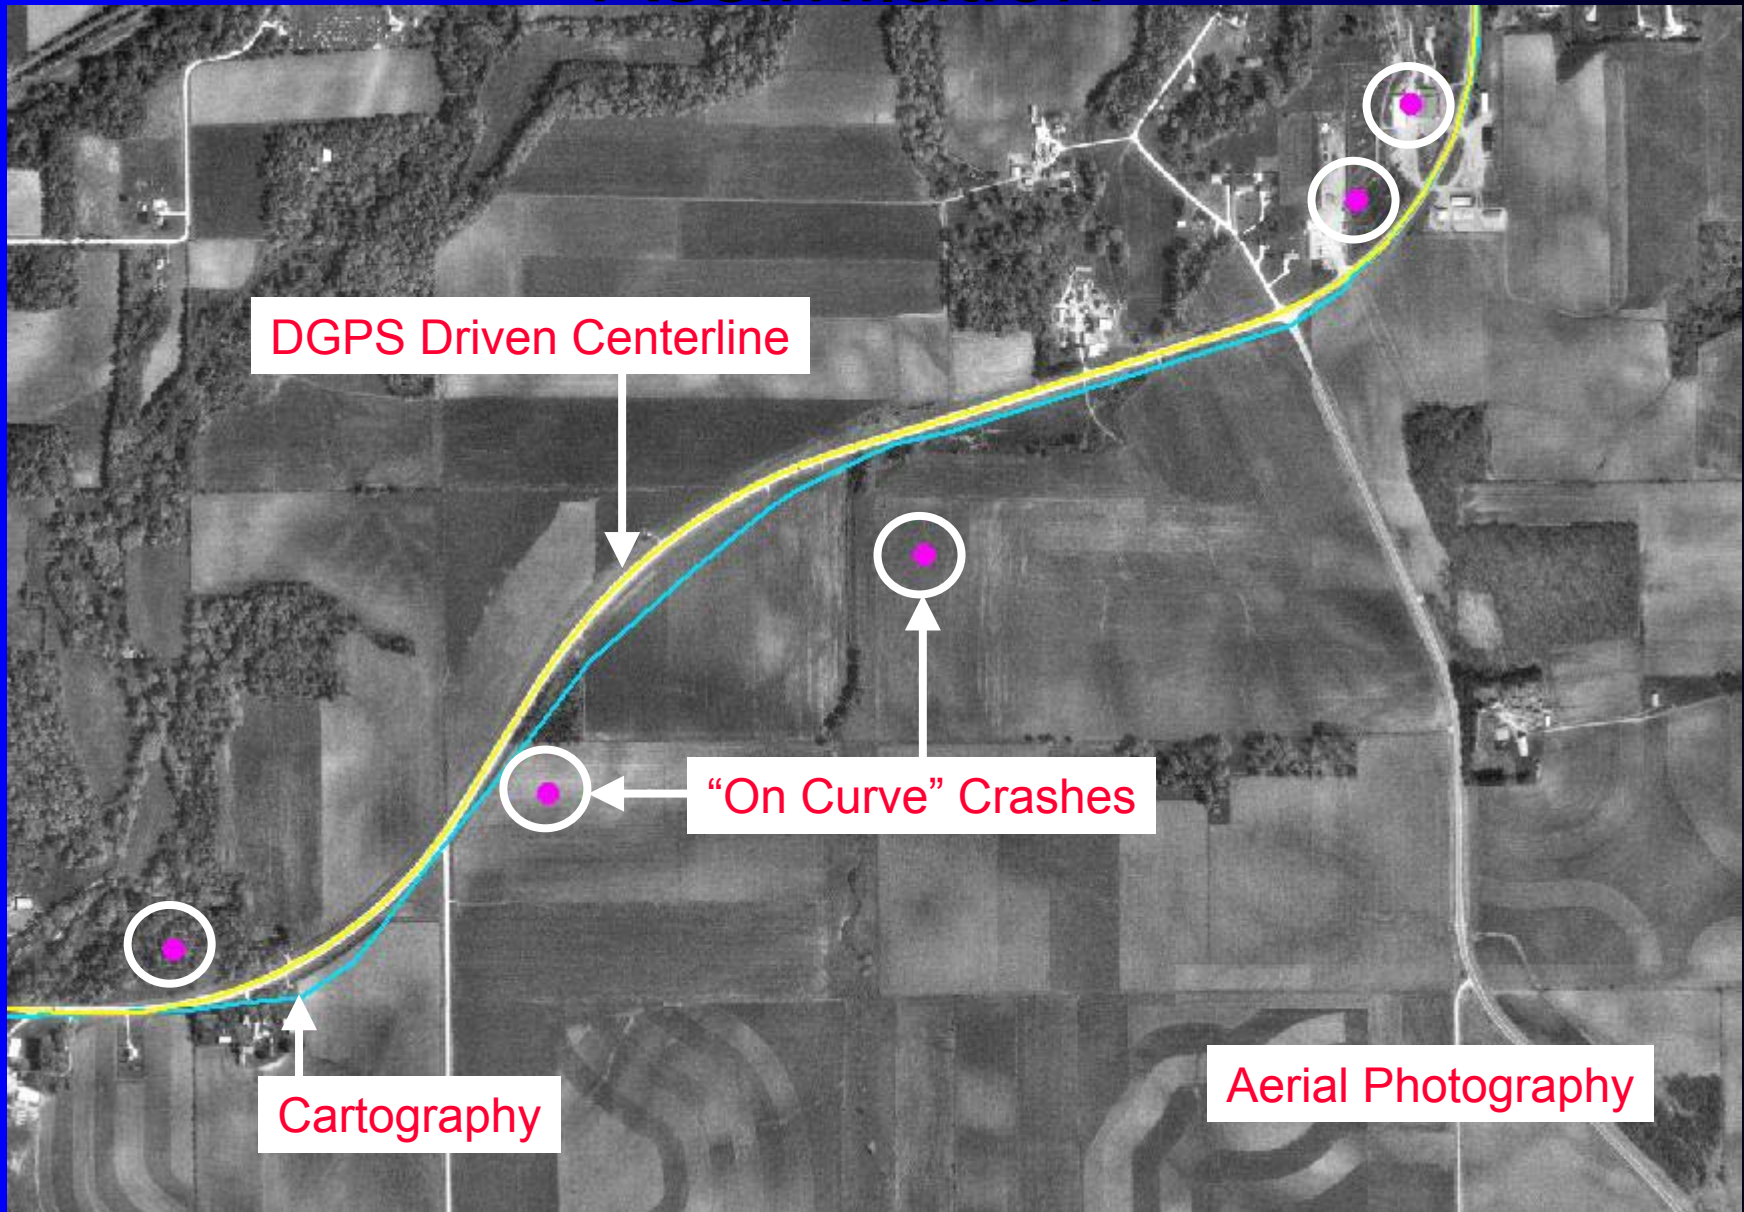

# Study Topics

# Type 1: Curve Methodology

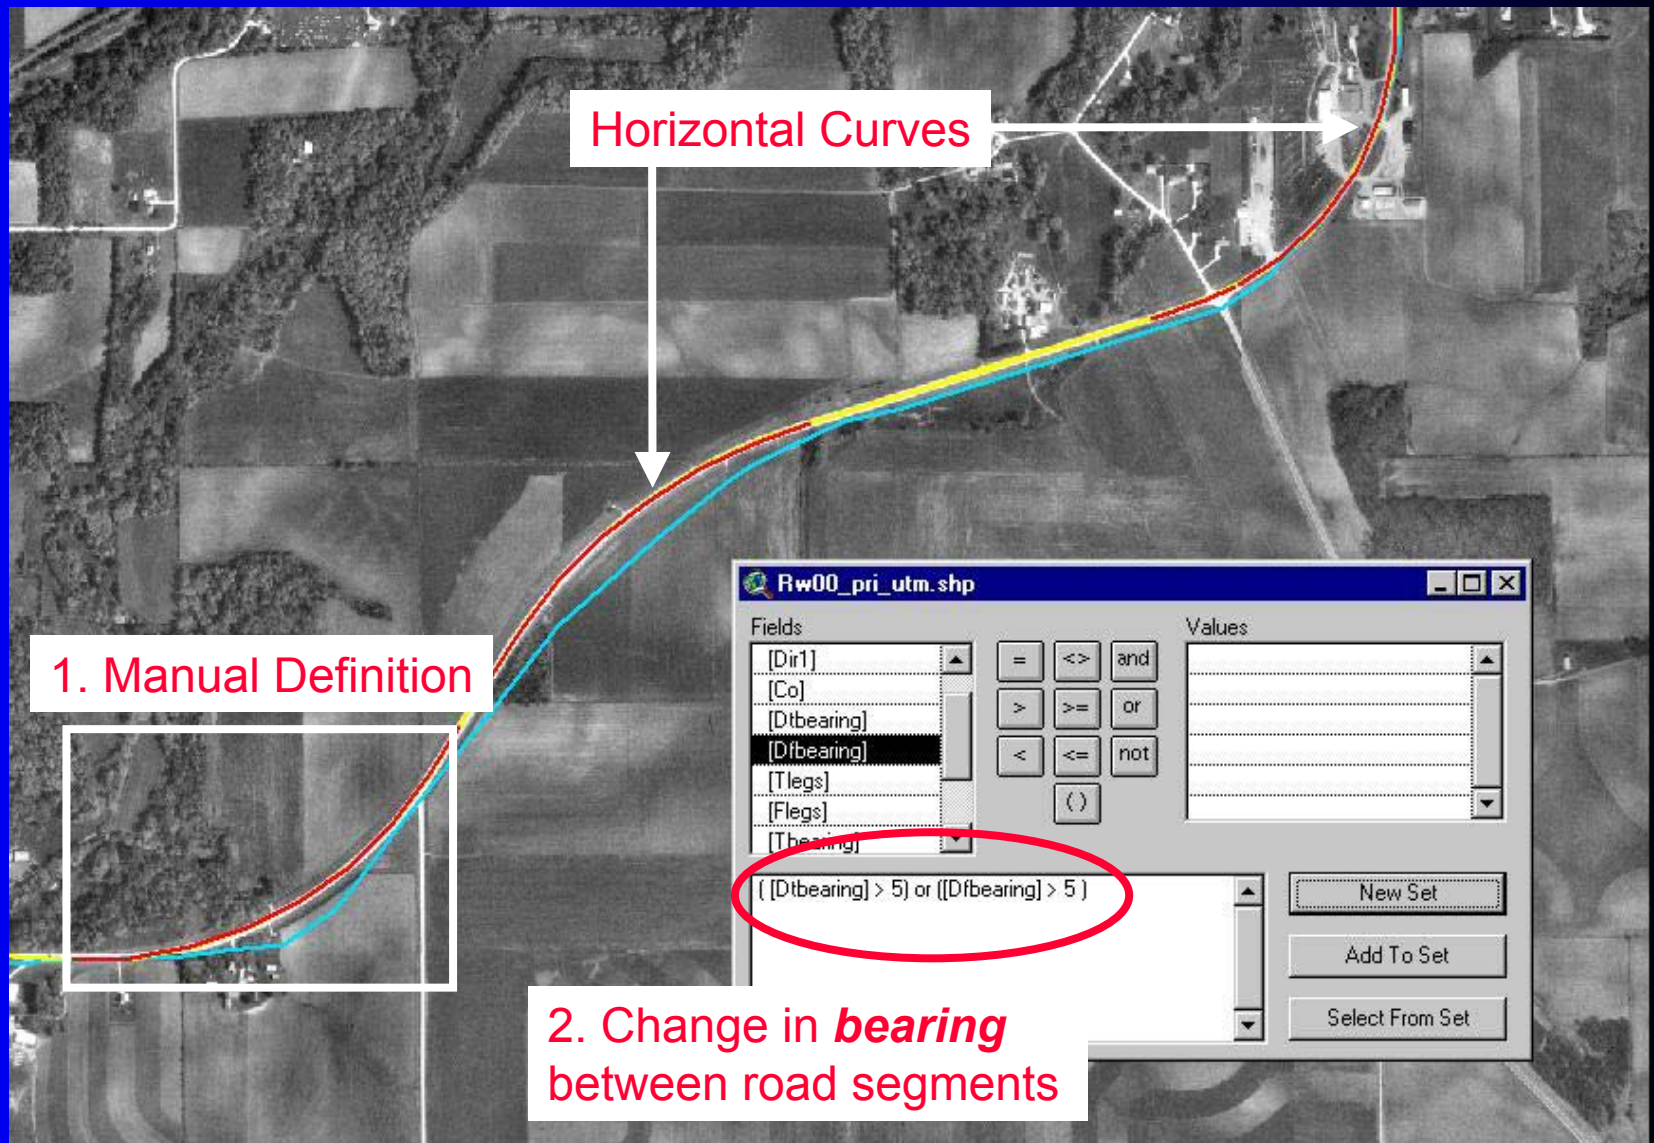

# Type 1: Curves – Existing Data Assimilation

# Type 1: Curves – Identification & Creation of Horizontal Curve GIS

Derived from new  
horizontal curves GIS

$$\frac{C}{2} = R \sin \theta; \text{ see triangle xyz}$$

$$\frac{C}{L} = \frac{\sin \theta}{\theta}$$

$$f(\theta_n) = \frac{\sin \theta_n}{\theta_n} - \frac{C}{L}$$

$$f'(\theta_n) = \frac{\cos \theta_n}{\theta_n} - \frac{\sin \theta_n}{\theta_n^2}$$

$$\theta_{n+1} = \theta_n - \frac{f(\theta_n)}{f'(\theta_n)}; \quad n = 0, 1, 2, \dots$$

$$D = \frac{5729.579}{R}$$

# Type 1. Curves – Ranking

# Type 1. Curves – Statistical Analysis

## Primary Roads Statewide (~ 2,000 curves with two or more crashes in 10 yrs)

- Statewide average = 1.1 / MVM (avg radius = 2850 ft., avg length = 870 ft.)
- Top 30 average = 11.7 (7.2\*) / MVM (avg radius = 1780 ft., avg length = 807 ft.)
- Worst (of top 30) = 78 / MVM
- **5%** of crashes occur at top 30 locations (1% of curves)
- **11%** of fatalities occur at top 30 locations
- Curve length and degree of curvature are significant causal variables.

\* Weighted average

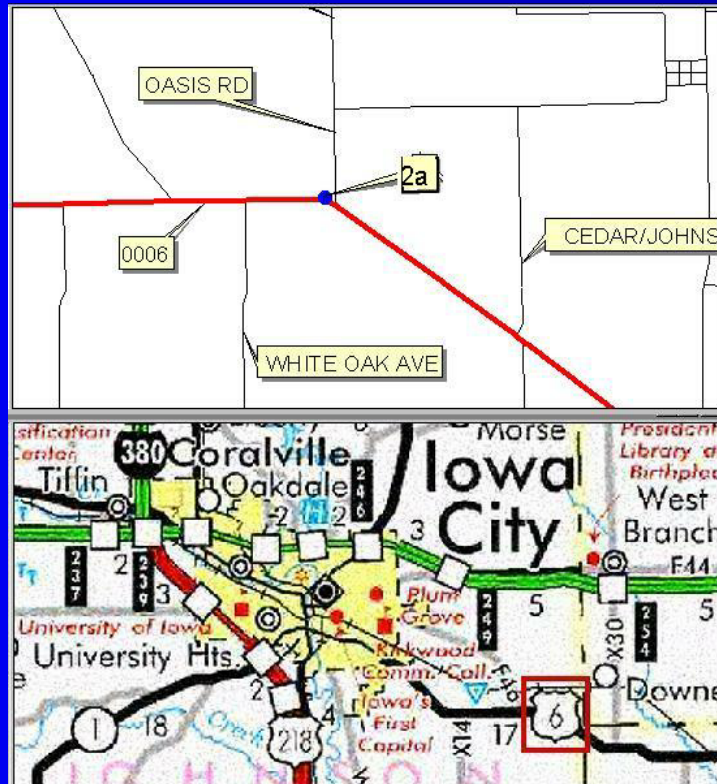

# Type 1. Curves – Adjustment

Should the three curves be analyzed as one?  
Are the crashes caused by the overpass icing?

# Type 1. Curves – Validation/Education

**Primary Highways**

**Story County Roads**

# Type 1. Curves – Validation/Education

Results changed where animal crashes were removed, e.g., curve #24, 18/23 were animal related

**High Crash Curves Validation  
(Northwest Iowa District)**

# Type 1. Curves

- Application of Low Cost, Corrective Measures

BEFORE

US 6 Johnson County

3<sup>rd</sup> highest statewide curve crash location

AFTER

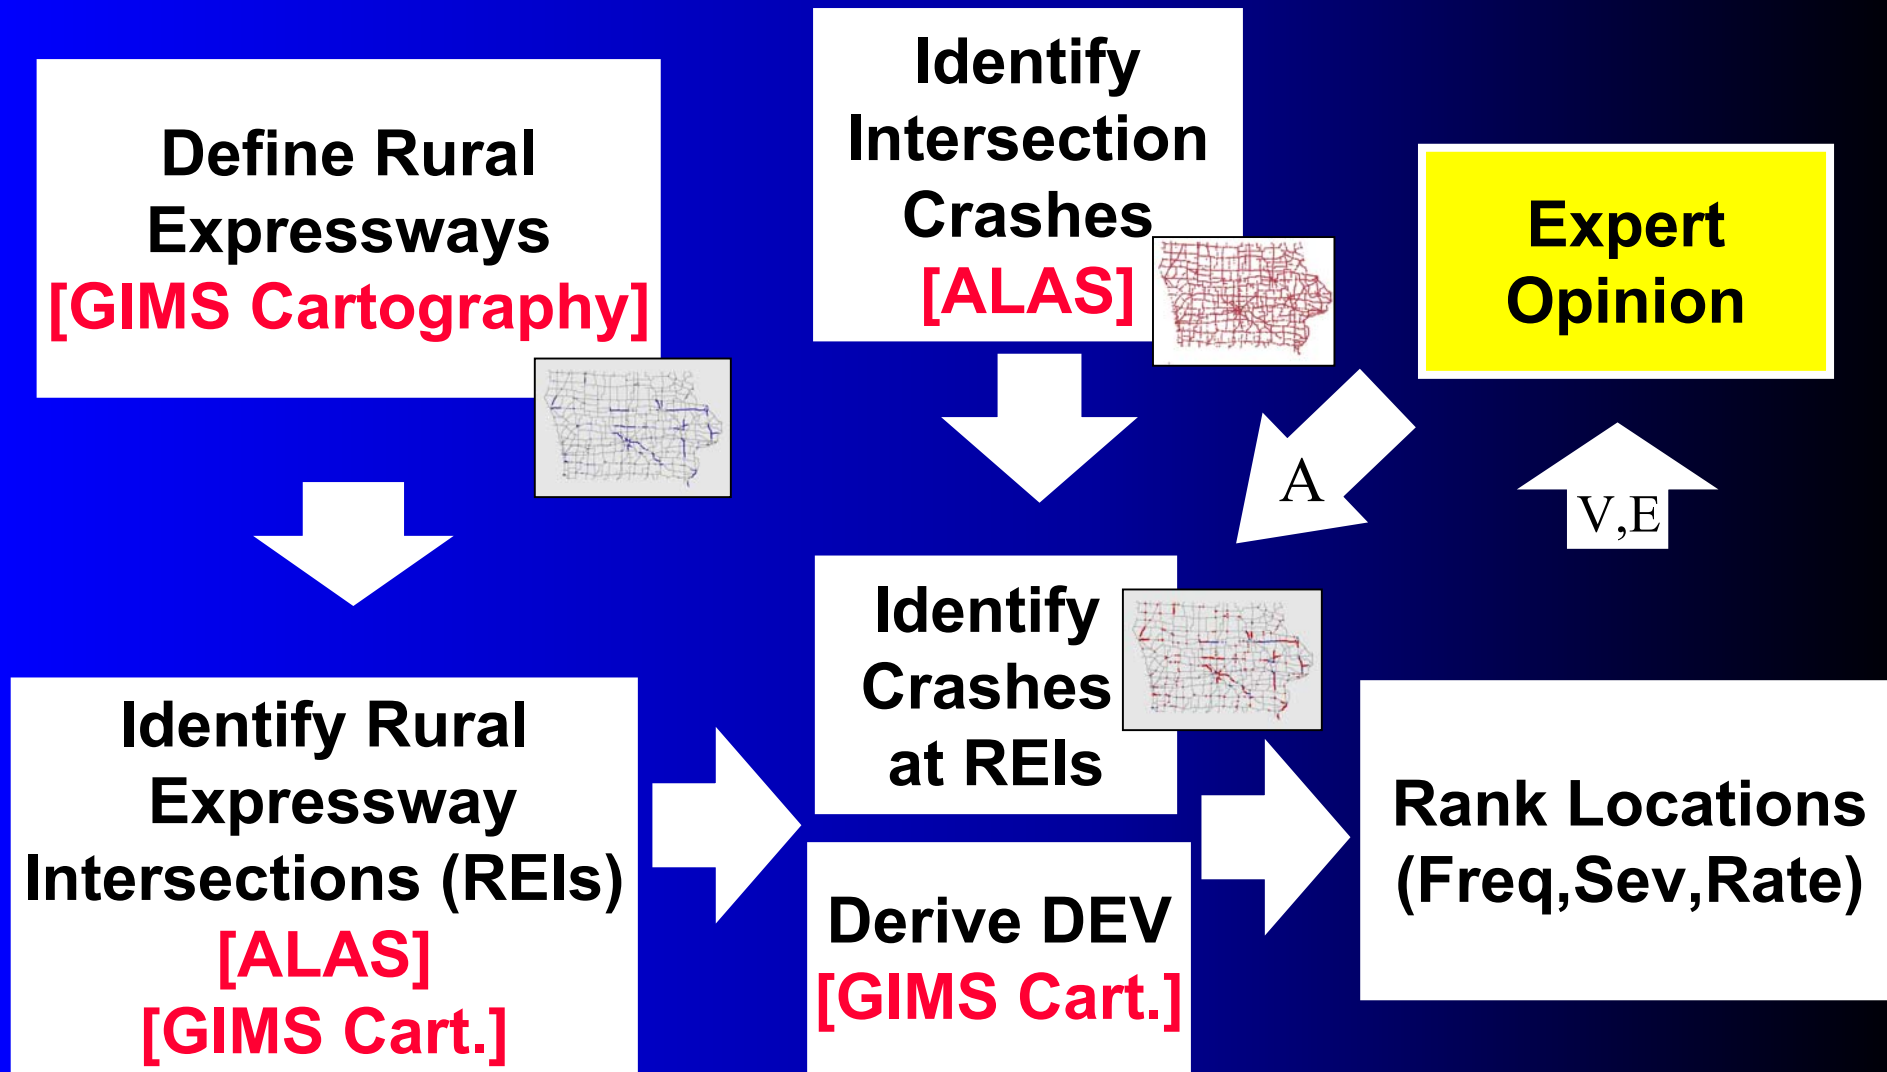

US 6 Johnson County

?

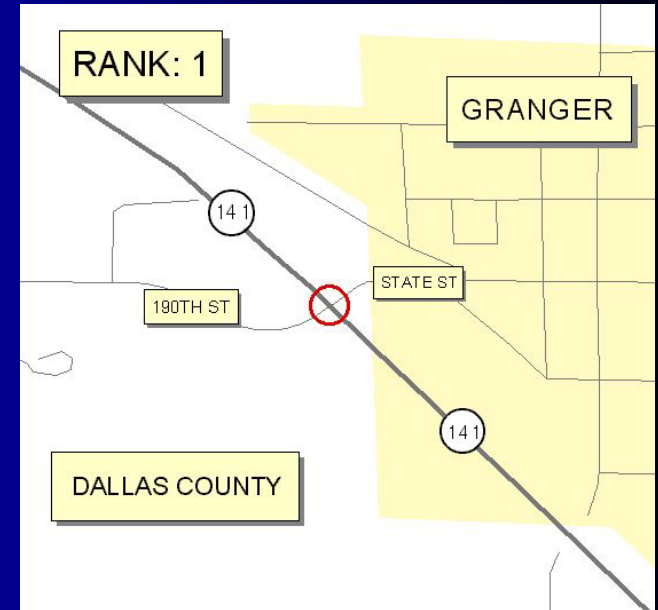

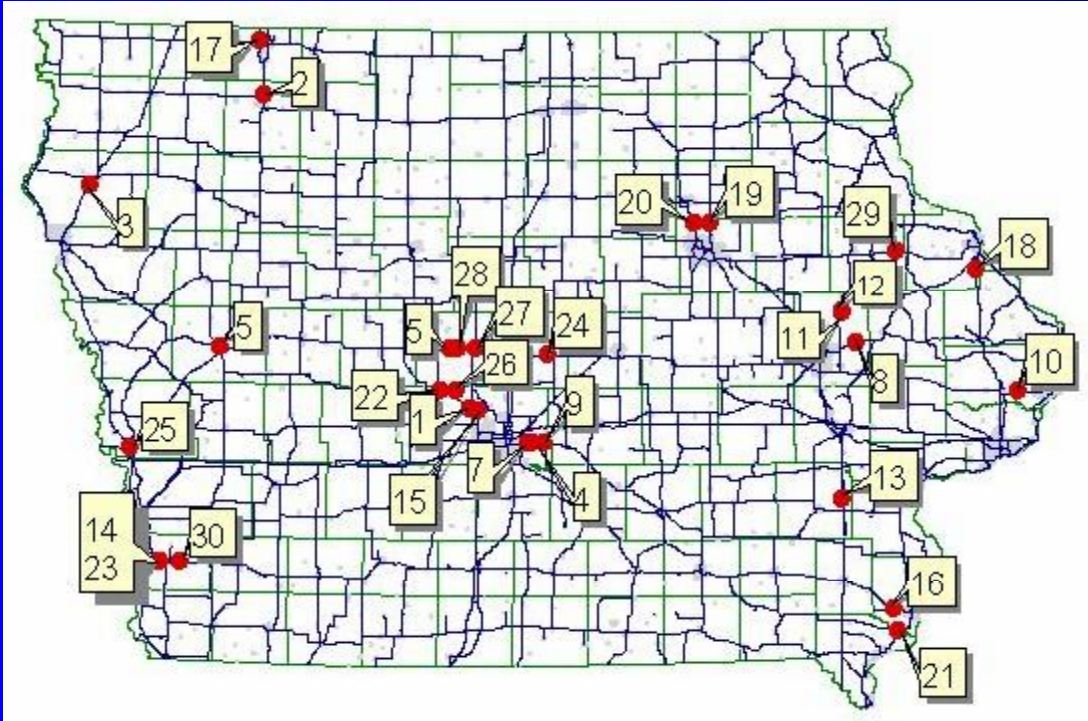

# Study Topics

# Type 2. Rural Expressway Methodology

# Type 2. Rural Expressway Intersections

## Primary Roads (~350 Intersections -- Statewide)

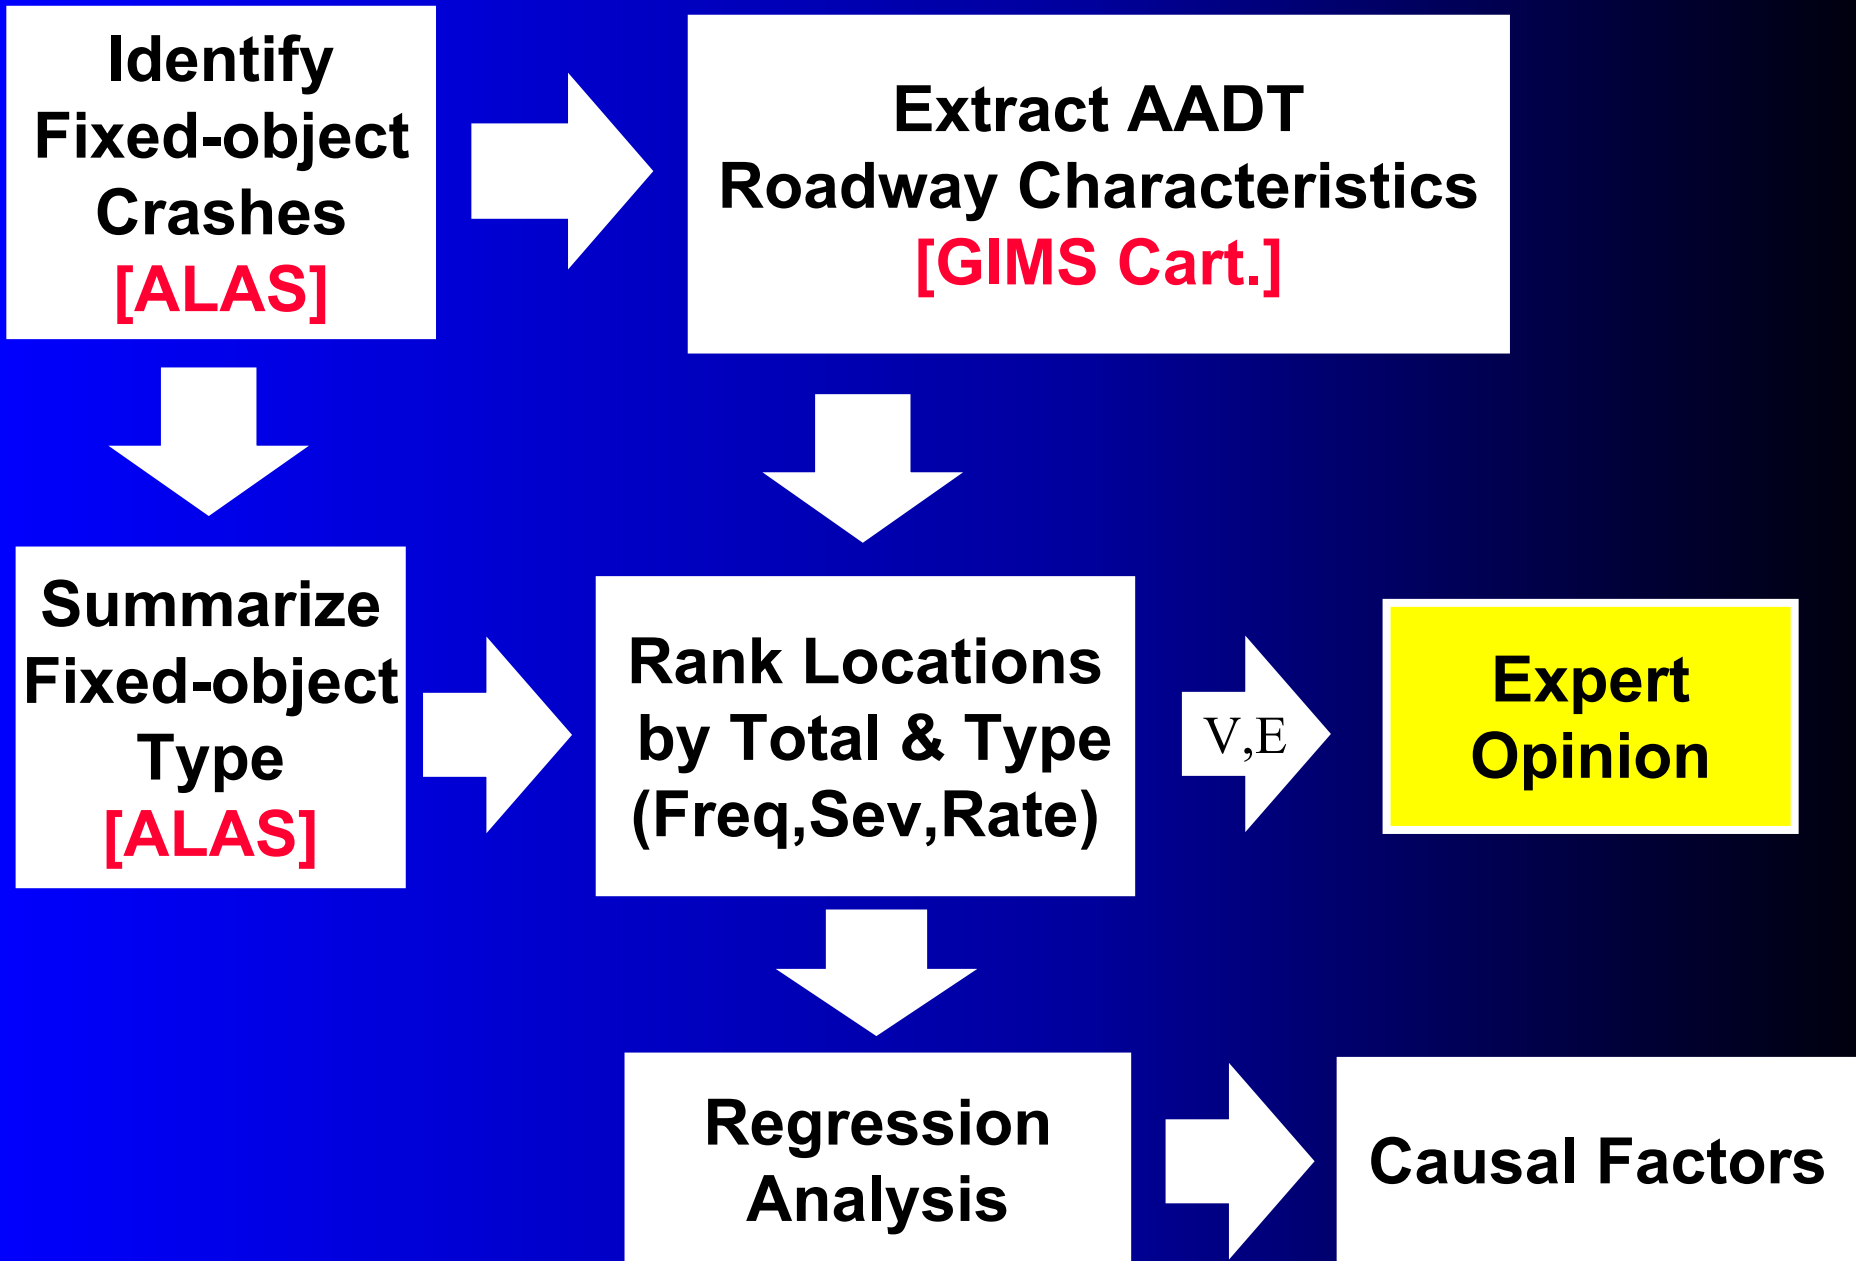

- Statewide average = 0.24 / MEV
- Top 30 average = 0.76 / MEV (Worst = 1.62 / MEV)
- **35%** of crashes occur at top 30 locations (9.2% of locations)
- **81%** of fatalities occur at top 30 locations

# Study Topics

# Type 3. Fixed-object Methodology

# Type 3a. Fixed-Object Results

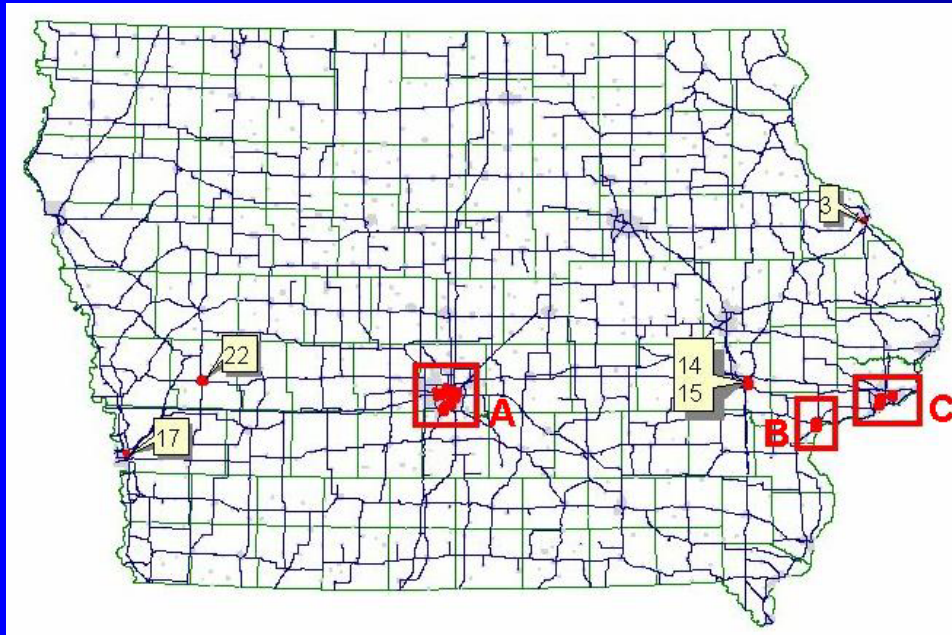

## Primary, Secondary, Municipal Roads (Statewide)

- Statewide average = 0.50\* / MVM
- Top 30 average = 25.5 (7.7\*) / MVM (Worst = 167 / MVM)
- 0.6% of crashes occur at top 30 locations (0.07% of locations)
- 1.6% of fatalities occur at top 30 locations

\* Weighted average

# Type 3b. Fixed-Object Results (Utility Pole Struck)

## Primary, Secondary, Municipal Roads (Statewide)

Statewide average = 0.28 / MVM

- Top 30 average = 1.1 / MVM (Worst = 4.6 / MVM)
- 3.9% crashes occur at top 30 locations (0.7% of loc.)
- 6.5% fatalities occur at top 30 locations

•• Weighted average

# Type 3. Fixed-Objects Struck ...

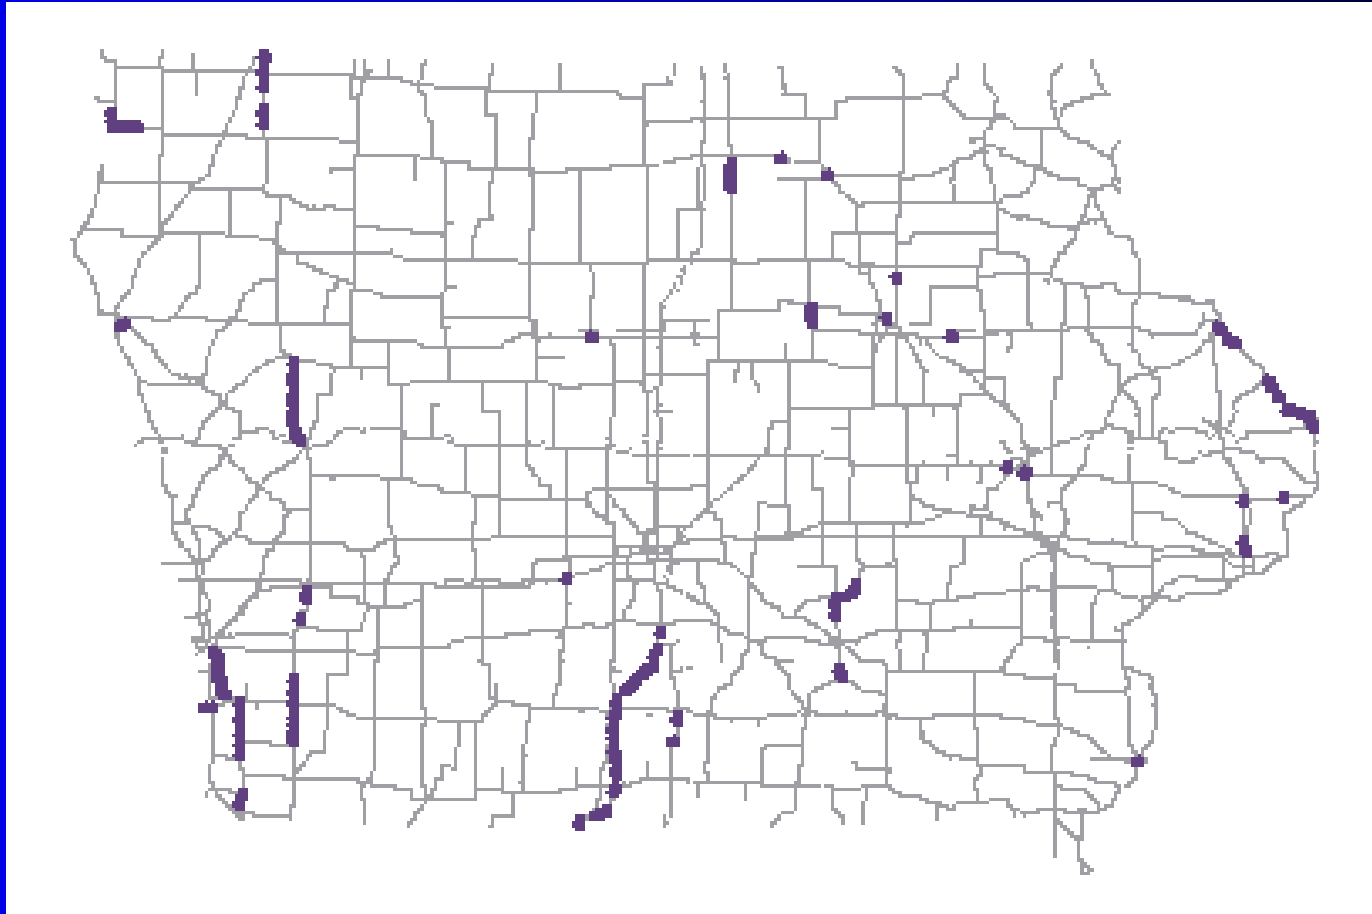

## Important Factors

- **Interstate:** terrain, pavement type, barriers
- **US Hwy:** barriers and surface width
- **Other Primary:** terrain, pavement
- **Farm:** shoulder & pavement type
- **Local:** terrain, pavement, #lanes, speed limit

... and, as expected, functional class matters

# Type 3. Potential Fixed-Object Problem Locations

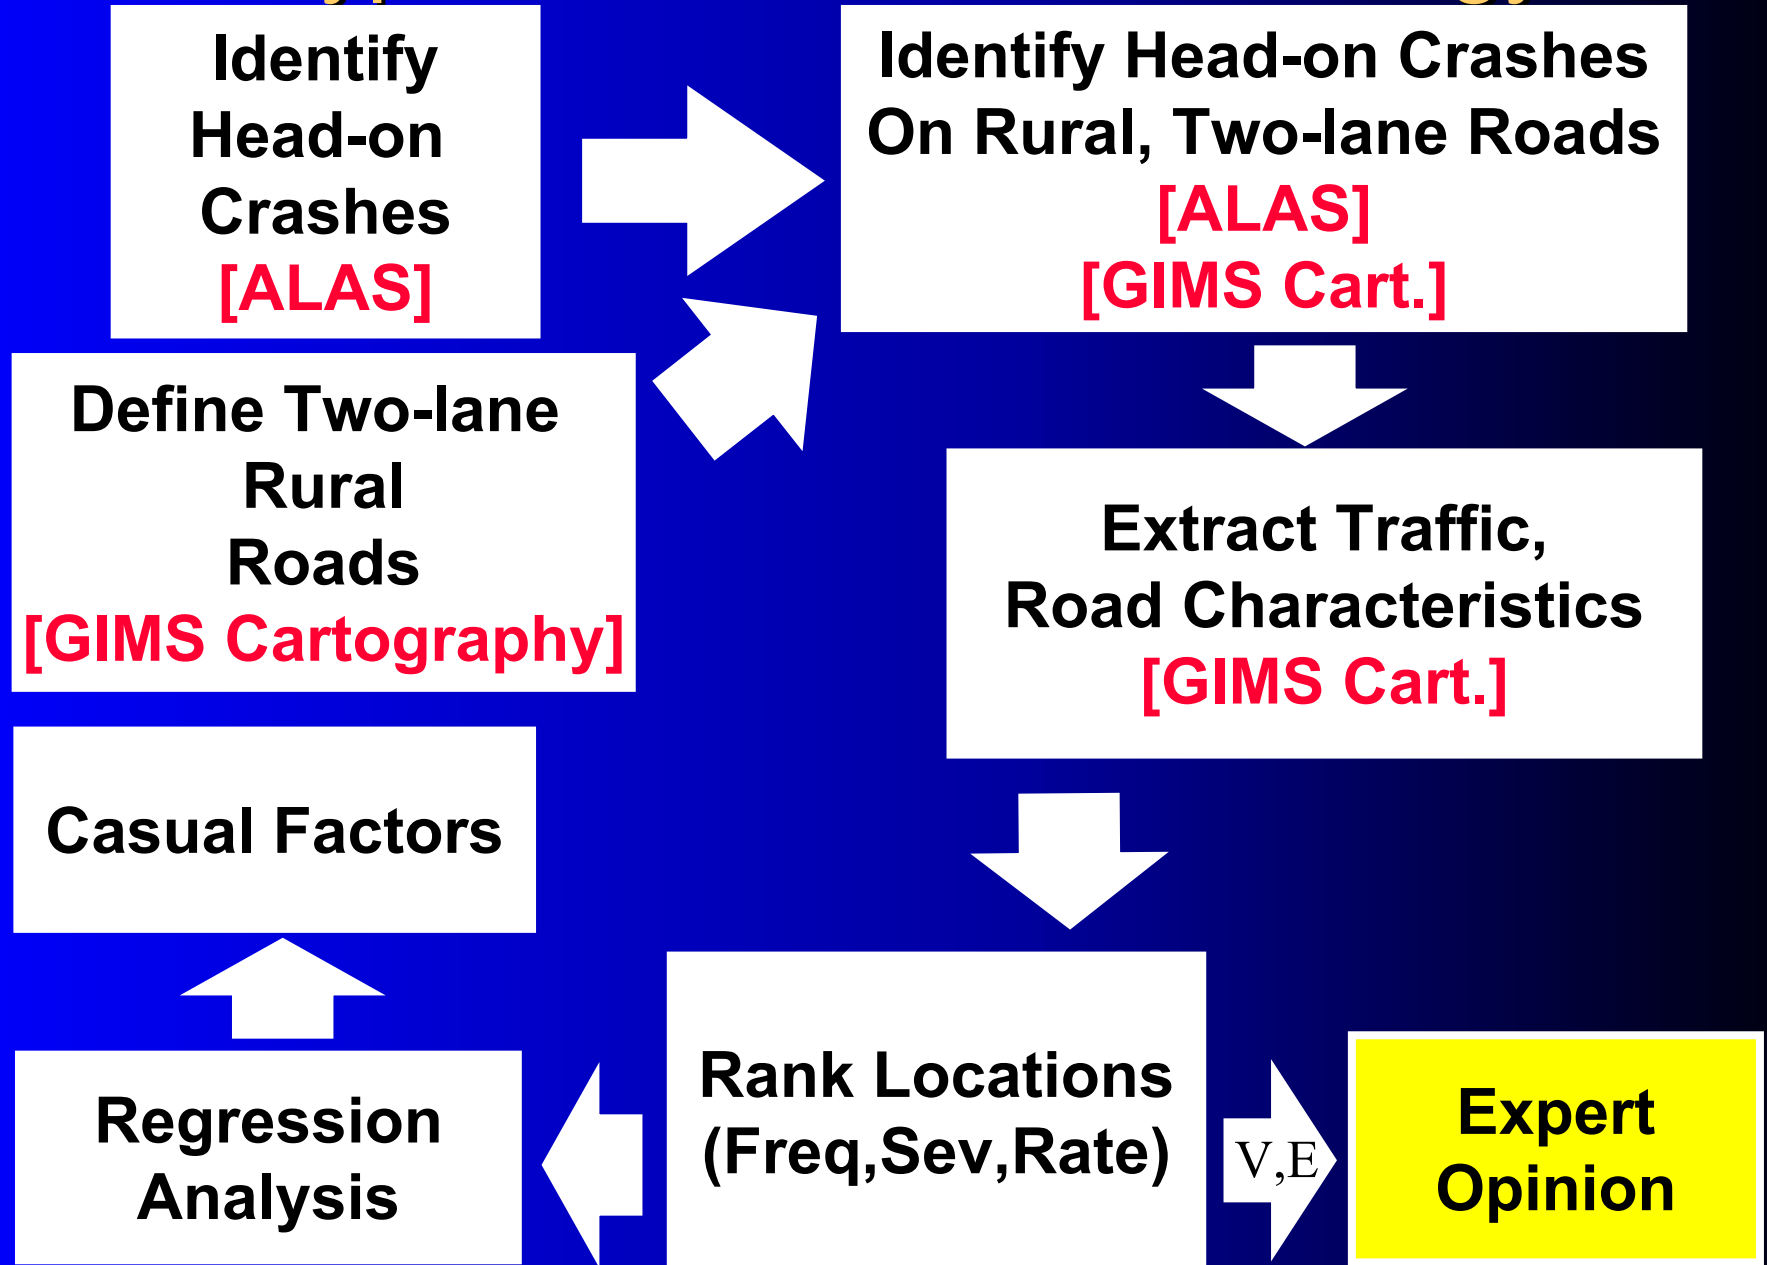

**US Highways, No Median Barrier, Narrower Surface Widths**

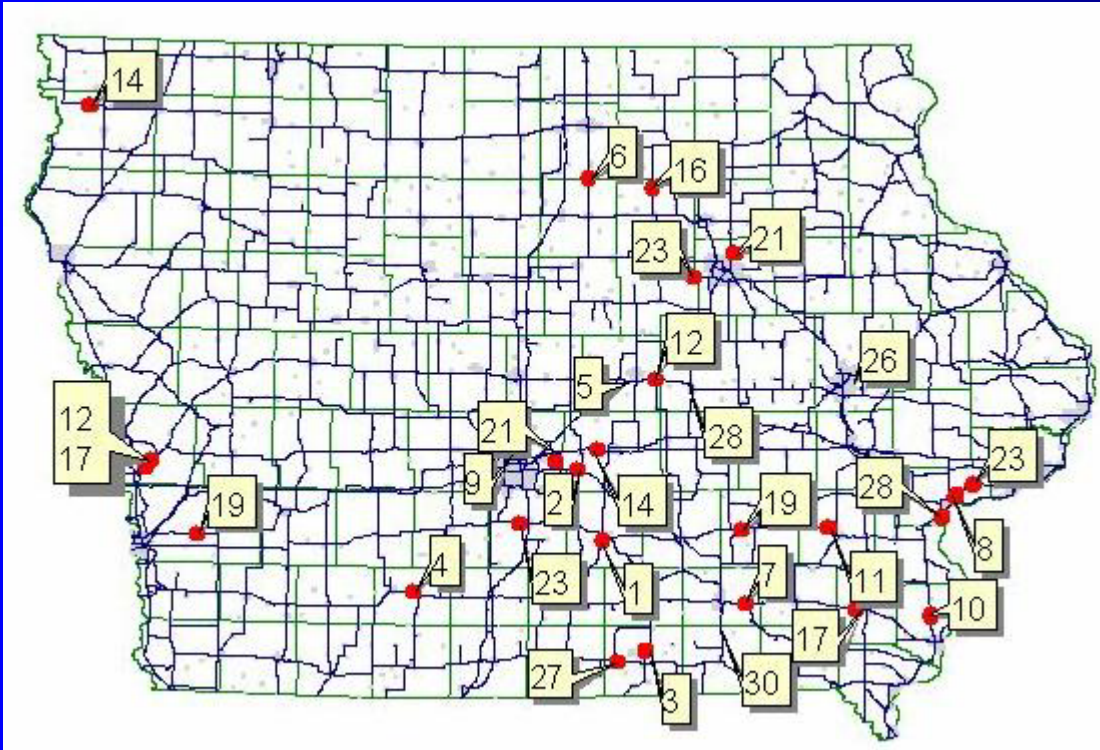

# Study Topics

# Type 4. Head-on Methodology

# Type 4. Head-on Results

## **Rural, Two-lane Paved Roads (Primary and Secondary - Statewide)**

- Statewide average = 0.21 / MVM
- Top 30 average = 0.91 (0.37\*) / MVM (worst = 11.9 / MVM)
- 3.1% of crashes occur at top 30 locations (0.9% of locations)
- 6.4% of fatalities occur at top 30 locations

\* Weighted average

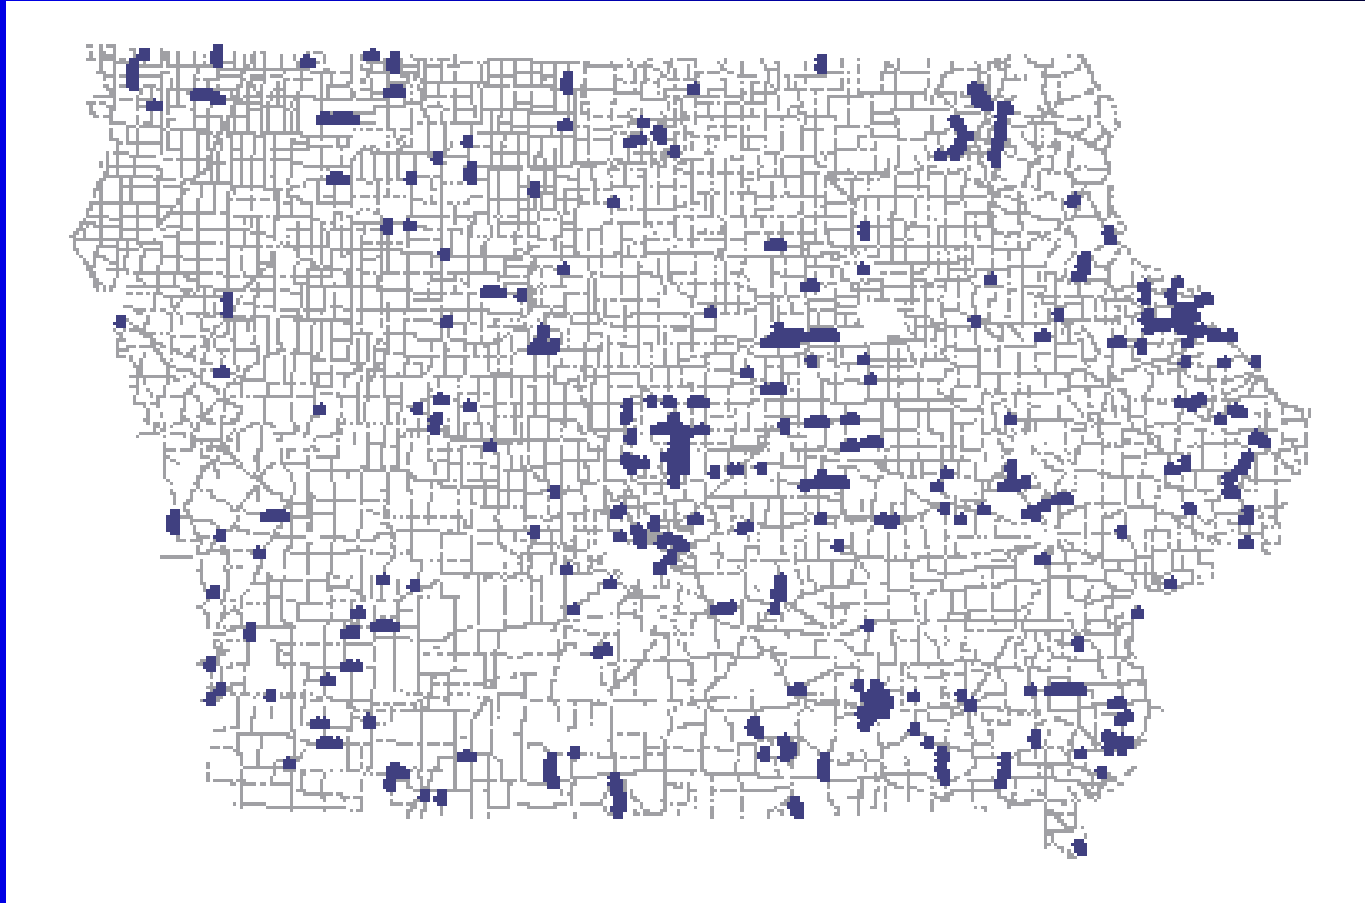

# Type 4. Head-on Collisions ...

## Important Factors

- **US Hwy:** terrain, shoulder width, speed limit
- **Other Primary:** speed limit, shoulder width, IRI
- **Farm:** shoulder width and paved shoulders

... and, as expected, functional class matters

# Type 4. Potential Head-on Problem Locations

**Farm-to-Market, Unpaved, Narrow Shoulders**

# Study Topics

# Type 5a. Undivided, 4-lane Segments

## Urban, Primary (Statewide, includes intersection crashes)

- Statewide average = 10.0 / MVM
- Top 30 average = (12.3\*) / MVM (worst = 50.7 / MVM)
- 65% of crashes occur at top 30 locations (46% of locations)
- 71% of fatalities occur at top 30 locations

\* Weighted average

A map of the state of Iowa, overlaid with a grid of green lines representing county boundaries. Thirty red dots are placed at various locations across the state, each labeled with a number from 1 to 30. The numbers are: 1 (near the southeast corner), 2 (near the east coast), 3 (near the northwest corner), 4 (central-west), 5 (central-north), 6 (northwest), 7 (central-east), 8 (central-south), 9 (southeast), 10 (central), 11 (northwest), 12 (central), 13 (north-central), 14 (east), 15 (northwest), 16 (central), 17 (central), 18 (southwest), 19 (central), 20 (southeast), 21 (central), 22 (north-east), 23 (central), 24 (east), 25 (southeast), 26 (central-south), 27 (north-east), 28 (southwest), 29 (central-east), 30 (central-west). The numbers are arranged in a way that suggests a potential path for a Traveling Salesman Problem.

# Project Benefits

- **More Systematic Approach to Identify Existing and Potential High Crash Locations**
- **Additional Safety Tool in Safety Toolbox**
- **More Efficient Use of Funding for Safety Improvements**
- **Allows More Proactive Approach**
